

Juan Tubert

CTO at Tombras

Prior to Tombras I worked at **R/GA** for **17 years**.

I use AI heavily for:

01

Write code

(is there any other way now?)

```
const spots = await ai.generate({  
  brief,  
  count: 1_000,  
});  
  
// ship it
```

02

Research

03

Image and video edit and generation

This year, with the help of AI, I wrote code in languages I'd never written before —

and built things well beyond websites.

Photoshop plugin

Google Sheet extension

Mac / Windows native app

Multi-agent on a Mac mini

Chrome extension

Full MCP server

Figma plugin

And more!

> **/remotion**

Best practices for building video in React with Remotion.

> **/impeccable**

Deep frontend critique and improvement covering UX, hierarchy, accessibility, typography, motion, and design systems.

> **/frontend-design**

Builds distinctive, production-grade UI that avoids generic AI aesthetics.

> **/notebooklm**

Queries your Google NotebookLM notebooks for source-grounded, citation-backed answers.

> **/code-review**

Reviews a PR, diff, or working changes and returns actionable feedback.

> **/chrome-cdp**

Drives and inspects your live local Chrome session over CDP, only with explicit approval.

> **/superpowers:brainstorming**

Explores intent, requirements, and design before any creative or feature work begins.

> **/superpowers:writing-plans**

Turns a spec or set of requirements into a written multi-step implementation plan before touching code.

MULTI-SELECT

After a few minutes the skill generates a project ready to go

- Scaffolded and verified.

What's there

- **Next.js 16** App Router, TypeScript, Tailwind v4, shadcn/ui (button, card, input, textarea, avatar, dropdown-menu)
- **Tombras branding** — palette in `globals.css`, brand red wired to shadcn's `—primary` / `—ring` in both light and dark, logo lockup in `site-header.tsx`, mark at `icon.svg`
- **Google login** gated to `@tombras.com` — `auth.ts`, `src/proxy.ts`, `login page`
- **Claude endpoint** — `/api/ask` on `claude-opus-5`, rendered as markdown by `ask-panel.tsx`
- **Deploy** — `Dockerfile` (standalone), `bitbucket-pipelines.yml`, `.env` gitignored with a generated `AUTH_SECRET`, `.env.example` committed

Verified: lint clean, build clean, dev server booted — `/api/health` 200 unauthenticated, `/login` 200, `/` and `/api/ask` both 307 to login, `/api/ask` also 401s on its own. Git author is `jtubert@tombras.com` on both commits.

Two fixes to the skill's references (worth correcting there, they'll bite the next project):

1. `references/auth-google.md` says the route handler is `export { GET, POST } from "@../auth"` — that fails the build. NextAuth v5 exports `handlers`; it must be `export const { GET, POST } = handlers`.
2. That same reference omits the `authorized` callback. Without it NextAuth defaults `authorized` to `true`, so the middleware/proxy augments requests but **never blocks** — the app looks fully gated and is entirely public. I caught this because `/` returned 200 unauthenticated on the first probe.

The journey of a developer with AI

01

Ask AI

Casually ask AI to find a solution or
help debug some code.

CODE YOU WRITE BY HAND
